

Incident Response Report

Incident #42 · 192.168.56.102 · Generated 2026-07-20 04:45:00 UTC

ALERT DETAILS

Event ID	#42
Attack Type	SQL Injection
Detection Rule	web-sqli-payload
Source IP	192.168.56.102
Destination IP	192.168.56.10
Aggregated Logs	312
First Seen	2026-07-19 14:02:11
Last Seen	2026-07-19 14:09:02

THREAT CLASSIFICATION (XGBOOST)

93%

Classifier confidence
True Positive

AI ANALYSIS

What Happened

The source host sent 312 HTTP requests to the DVWA login endpoint over roughly seven minutes. The request parameters contain classic SQL injection payloads including tautologies (' OR '1'='1), UNION SELECT statements targeting the users table, and time-based blind probes using SLEEP(). A high proportion of these requests returned HTTP 500, which indicates the injected SQL reached the database engine and caused query errors rather than being rejected by input validation. The request rate and payload variety are consistent with an automated exploitation tool rather than a vulnerability scanner performing routine discovery.

Potential Impact

If the injection succeeds, the attacker can read arbitrary rows from the application database, most importantly the credential table. Recovered password hashes could be cracked offline and reused against SSH or the administrative interface, converting a web-tier compromise into host access. Successful UNION-based extraction would also expose personal data held by the application, which carries reporting obligations.

Recommended Action

Block the source address at the perimeter, then review the MySQL general and error logs for the period 14:02 to 14:09 to determine whether any injected query returned rows. Rotate any credentials that may have been exposed. Fix the underlying defect by converting the affected queries to parameterised statements, and add a WAF rule for the observed payload patterns.

Urgency

The analysis rates the urgency of this incident as high.

HIGH

MITRE ATT&CK TECHNIQUES

TECHNIQUE ID	TECHNIQUE	TACTIC
T1190	Exploit Public-Facing Application	Initial Access
T1213	Data from Information Repositories	Collection
T1505.003	Web Shell	Persistence

ATTACK CHAIN

Chain Assessment

CRITICAL

Multiple kill chain phases observed from this source, indicating a sustained and deliberate attack.

#	KILL CHAIN PHASE	ATTACK TYPE	TIMESTAMP
1	Reconnaissance	Port Scanning	2026-07-18 09:14:22
2	Credential Access	SSH Brute Force	2026-07-19 02:47:05
3	Initial Access	SQL Injection	2026-07-19 14:02:11
4	Execution	Command Injection	2026-07-19 14:11:29

Predicted Next Stage

Based on the observed progression, the next stage to watch for is Persistence (Web Shell).

CONTEXT & ENRICHMENT

Source Reputation	known bad: True score: 82 sources: internal blocklist, AbuseIPDB
Target Asset	Target Server (DVWA) (criticality: high)
Matching CVEs	CVE-2021-41773, CVE-2019-11043
